ABSTRACT

Describe what your project presents within 150 words.

MovieFlix is a fast and intelligent movie search and recommendation system designed to help users find relevant movies efficiently from large movie databases. The system allows users to search movies using title, actor, genre, language, rating, release year, and keywords. It provides features such as auto-complete suggestions, filtering, sorting, trending movies, top-rated movies, personalized recommendations, watch history, watch-later lists, and recent search caching. The project applies various Data Structures and Algorithms to improve performance and organize movie data effectively. Hash tables are used for fast movie lookup, BST and AVL trees support efficient searching, Tries provide auto-complete functionality, heaps manage trending and top-rated movies, and graphs support movie recommendations using BFS and DFS. Sorting and searching algorithms are used to retrieve and organize movies efficiently. MovieFlix demonstrates the practical application of DSA concepts in a real-world system while providing users with a faster, organized, and improved movie-search experience.
